# 2A 23V Synchronous Step-Down Converter

## **FEATURES**

- 2A Continuous Output Current
- Programmable Soft Start
- 130mΩ Internal Power MOSFET Switches
- Stable with Low ESR Output Ceramic Capacitors
- Up to 93% Efficiency
- <1µA Supply Current in Shutdown Mode</li>
- Fixed 340KHz Frequency
- Thermal Shutdown
- Cycle by Cycle Over Current Protection
- Wide 4.75 to 23V Operating Input Range
- Output Adjustable from 0.925V to 12V
- Under Voltage Lockout

## APPLICATIONS

- Networking Systems such as Modems & Routers
- Distributed Power Systems
- Pre-Regulator for Linear Regulators.
- Set-top Box

## DESCRIPTION

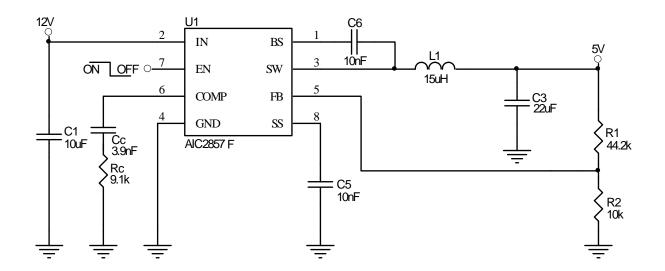

The AIC2857F is a synchronous step-down regulator with an integrated Power MOSFET. It achieves 2A continuous output current over a wide input supply range with excellent load and line regulation.

Current mode operation provides fast transient response and eases loop stabilization.

Fault condition protection includes cycle-bycycle current limiting and thermal shutdown. Adjustable soft-start reduces the stress on the input source and the output overshoot at turnon. In shutdown mode, the regulator draws 1µA or less of supply current.

The AIC2857F is available in SOP8 and SOP8 with Exposed Pad Package.

## TYPICAL APPLICATIONS CIRCUIT

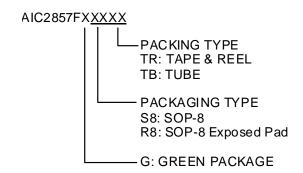

**Typical Application Circuit** 

Analog Integrations Corporation Si-Soft Research Center DS-2857FG-02 20120103 3A1, No.1, Li-Hsin Rd. I, Science Park, Hsinchu 300, Taiwan, R.O.C.

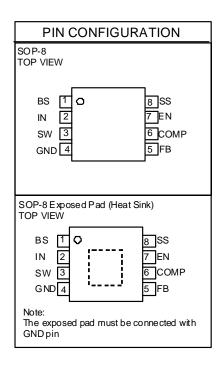

## ORDERING INFORMATION

### Example:

#### AIC2857FGR8TR

→ GREEN SOP-8 Exposed Pad (Heat Sink) Package and TAPE & REEL Packing Type

## ABSOLUTE MAXIMUM RATINS

Input Voltage (V <sub>IN</sub> )		0.3V to 26V
SW pin Voltage (V <sub>SW</sub> )		1V to V <sub>IN</sub> +0.3V
BS Pin Voltage		V <sub>SW</sub> -0.3V toV <sub>SW</sub> +6V
EN Pin Voltage		0.3V to V <sub>IN</sub>
All Other Pins Voltage		0.3V to 6V
Operating Ambient Temperature Range T <sub>A</sub>		40°C~85°C
Operating Maximum Junction Temperature T <sub>J</sub>		
Storage Temperature Range T <sub>STG</sub>		65°C~150°C
Lead Temperature (Soldering 10 Sec.)		260°C
Thermal Resistance Junction to Case	SOP-8	40°C/W
	SOP-8 Exposed Pad*	15°C/W
Thermal Resistance Junction to Ambient	SOP-8	160°C/W
	SOP-8 Exposed Pad*	60°C/W

(Assume no Ambient Airflow)

Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

\*The package is place on a two layers PCB with 2 ounces copper and 2 square inch, connected by 8 vias.

## ■ ELECTRICAL CHARACTERISTICS

(V<sub>IN</sub>=12V, V<sub>EN</sub> =5V, T<sub>A</sub>=25°C, unless otherwise specified.) (Note1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Shutdown Supply Current		$V_{EN} = 0V$		0.3	3	μА
Supply Current		V <sub>FB</sub> = 1.0V		1.3	1.5	mA
Feedback Voltage	$V_{FB}$	$4.75$ V $\leq$ V <sub>IN</sub> $\leq$ 23V	0.90	0.925	0.950	V
Feedback Overvoltage Threshold				1.1		V
Error Amplifier Voltage Gain	$A_{EA}$			400		V/V
Error Amplifier Transconductance	G <sub>EA</sub>	$\Delta I_{COMP} = \pm 10 \mu A$		820		μ <b>Α</b> /V
High-Side Switch On-Resistance	R <sub>DS (ON) 1</sub>			130		mΩ
Low-Side Switch On-Resistance	R <sub>DS (ON) 2</sub>			130		mΩ
High-Side Switch Leakage Current		$V_{EN} = 0V$ , $V_{SW} = 0V$		0	10	μΑ
Upper Switch Current Limit		Minimum Duty Cycle	2.7	3.4		Α
Lower Switch Current Limit		From Drain to Source		0.9		Α
COMP to Current Sense				5.2		A/V
Transconductance	G <sub>CS</sub>			5.2		AVV
Oscillation Frequency	f <sub>OSC</sub>		300	340	380	KHz
Short Circuit Oscillation Frequency		V <sub>FB</sub> = 0V		110		KHz
Maximum Duty Cycle	$D_{MAX}$	V <sub>FB</sub> = 0.8V		90		%
Minimum On Time	T <sub>ON</sub>			220		ns
EN Shutdown Threshold Voltage		V <sub>EN</sub> Rising	1.1	1.5	2.2	V
EN Shutdown Threshold Voltage				220		m\/
Hysteresis				220		mV
Under Voltage Lockout Threshold		V <sub>IN</sub> Rising	3.7	4.1		V
Under Voltage Lockout Threshold				210		mV
Hysteresis				210		IIIV
Soft-Start Current		$V_{SS} = 0V$		6		μА
Soft-Start Period		C <sub>SS</sub> = 0.1μF		15		ms
Thermal Shutdown				160		°C

- Note 1: Specifications are production tested at  $T_A$ =25°C. Specifications over the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with Statistical Quality Controls (SQC).
- Note 2: It is recommended to use duty ratio above 10% for minimizing resultant duty cycle jitter.
- Note 3: It is recommended to connect a soft start capacitor to soft start pin. Leave the soft start pin open may cause large inrush current and output overshooting.

# **BLOCK DIAGRAM**

Functional Block Diagram of AIC2857F

## PIN DESCRIPTIONS

Pin 1: BS: High Side Gate Drive Boost Input.

BS supplies the drive for the highside N-Channel MOSFET switch. Connect a 10nF or greater capaitor from SW to BS to power the

high-side switch.

Pin 2: IN: Power Input. IN supplies the

power to the IC, as well as the step-down converter switches. Drive IN with a 4.75 to 23V power source. By pass IN to GND with a suitably large capacitor to eliminate noise on the input to the IC.

Pin 3: SW: Power Switching Output. SW is

the switching node that supplies power to the output. Connect the output LC filter from switch to the output load. Note that a capacitor is required from SW to BS to

power the high-side switch.

Pin 4:GND: Ground. Connect the exposed

pad on backside to Pin 4.

Pin 5: FB: Feedback Input. FB senses the

output voltage to regulate that voltage. Drive feedback with a resistive voltage divider from the

output voltage.

Pin 6: COMP: Compensation Node. COMP is

used to compensate the regulation control loop. Connect a series RC network form COMP to GND to compensate the regulation control loop. In some cases, an additional capacitor from

COMP to GND is required.

Pin 7: EN: Enable Input. EN is a digital input

that turns the regulator on or off. Drive EN high to turn on the regulator. Drive it low to turn it off. For automatic strat-up, attach to IN with a 100kO pull up resistor.

IN with a  $100k\Omega$  pull up resistor.

Pin 8: SS: Soft Star Control Input. SS con-

trols the soft star period. Connect a capacitor from SS to GND to set the soft-star period. A  $0.1\mu F$  capacitor sets the soft-star period

to 15ms.

## APPLICATION INFORMATIONS

The AIC2857F is a synchronous high voltage buck converter that can support the input voltage range from

4.75V to 23V and the output current can be up to 2A.

#### **Setting the Output Voltage**

The output voltage is set using a resistive voltage divider connected from the output voltage to FB. The voltage divider divides the output voltage down to the feedback voltage by the ratio:

$$V_{FB} = V_{OUT} \frac{R2}{R1 + R2}$$

Thus the output voltage is:

$$V_{OUT} = 0.925 \times \frac{R1 + R2}{R2}$$

For example, for a 3.3V output voltage, R2 is  $10k\Omega$ , and R1 is  $26.1k\Omega$ .

#### Inductor

The inductor selection depends on the current ripple of inductor, the input voltage, and the output voltage.

$$L \geq \frac{V_{OUT}}{f_{OSC} \cdot \Delta I_L} \Biggl( 1 - \frac{V_{OUT}}{V_{IN}} \Biggr)$$

Accepting a large current ripple of inductor allows the use of a smaller inductance. However, higher current ripple of inductor can cause higher output ripple voltage and large core loss. By setting an acceptable current ripple of inductor, a suitable inductance can be obtained from above equation.

In addition, it is important to ensure the inductor saturation current exceeds the peak value of inductor current in application to prevent core saturation. The peak value of inductor current can be calculated according to the following equation.

$$I_{PEAK} = I_{OUT(max)} + \frac{V_{OUT}}{2 \times f_{OSC} \cdot L} \left(1 - \frac{V_{OUT}}{V_{IN}}\right)$$

#### Soft-Start

The AIC2857F provides the soft-start function. Initially, the voltage at SS pin is 0V. Then an internal current source of  $6\mu A$  (typ.) charges an external soft-start capacitor. During the soft-start period, the voltage at SS pin will limit the feedback threshold voltage at FB pin. When the voltage at SS pin is higher than 0.925V, the feedback threshold voltage at FB pin reaches the desired value. The soft-start time can be calculated in accordance with the following equation.

$$t_{SS} = C5 \times \frac{0.925 \text{V}}{6 \mu \text{A}}$$

The soft-start capacitor is discharged to GND when the EN pin is connected to GND.

#### **Optional Schottky Diode**

A Schottky diode with low forward drop voltage and fast reverse recovery is the ideal choice for better efficiency. The forward drop voltage of a Schottky diode will result in the conduction losses in the diode, and the diode capacitance ( $C_T$  or  $C_D$ ) will cause the switching losses. Therefore, it is necessary to consider both forward voltage drop and diode capacitance for diode selection. In addition, the rating of selected Schottky diode should be able to handle the input voltage and the maximum peak diode current.

#### **Input Capacitor and Output Capacitor**

To prevent the high input voltage ripple and noise resulted from high frequency switching, the use of low ESR ceramic capacitor for the maximum RMS current is recommended. The approximated RMS current of the input capacitor can be calculated according to the following equation.

$$I_{CINRMS} \approx \sqrt{I_{OUT(MAX)}^2 \times \frac{V_{OUT} \left(V_{IN} - V_{OUT}\right)}{V_{IN}^2} + \frac{\Delta I_L^2}{12}}$$

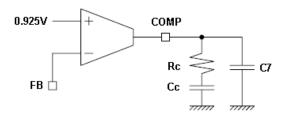

The selection of output capacitor depends on the required output voltage ripple. The output voltage ripple can be expressed as:

$$\Delta V_{OUT} = \frac{\Delta I_{L}}{8 \times f_{OSC} \times C3} + ESR \quad \Delta I_{L}$$

For lower output voltage ripple, the use of low ESR ceramic capacitor is recommended. The tantalum capacitor can also be used well, but its ERS is larger than that of ceramic capacitor.

When choosing the input and output ceramic capacitors, X5R and X7R types are recommended because they retain their capacitance over wider ranges of voltage and temperature than other types.

#### **Loop Compensation**

In order to avoid the poor output voltage ripple and low efficiency caused by instability, AIC2857F requires a proper external compensation network to compensate its feedback loop. In this external compensation network, the compensation resistor,  $R_{\text{C}}$ , and the compensation capacitor,  $C_{\text{C}}$ , are used to set the high-frequency integrator gain and the integrator zero. C7 is used to cancel the zero caused by the output capacitor and it's ESR. While using the ceramic capacitor as the output capacitor, C7 can be omitted due to the small ESR.

The system has one pole of importance, due to the output capacitor, C3 and the load resistor. This poles is located at:

$$F_{P1} = \frac{1}{2\pi \times C3 \times R_{LOAD}}$$

The system has one zero of importance, due to the compensation capacitor, Cc and the compensation resistor, Rc. This zero is located at:

$$F_{Z1} = \frac{1}{2\pi \times Cc \times Rc}$$

The system may have another zero of importance, if the output capacitor has a large capacitance and/or a high ESR value. The zero, due to the ESR and capacitance of the output capacitor, is located at:

$$F_{ESR} = \frac{1}{2\pi \times C3 \times R_{ESR}}$$

In this case, a third pole set by the compensation capacitor, C7 and the compensation resistor, Rc is used to compensate the effect of the ESR zero on the loop gain. This pole is located at:

$$F_{P2} = \frac{1}{2\pi \times C7 \times Rc}$$

The values of the compensation components given in this data sheet yield a stable control loop for the given output voltage and capacitor. If different conversions and output capacitors are requires, some values of the compensation components may need to be adjusted to ensure stability.

#### **Layout Consideration**

In order to ensure a proper operation of AIC2857F, the following points should be managed comprehensively.

- The input capacitor and V<sub>IN</sub> should be placed as close as possible to each other to reduce the input voltage ripple and noise.
- The output loop, which is consisted of the inductor, the internal power switch, the Schottky diode and the output capacitor, should be kept as small as possible.
- The routes with large current should be kept short and wide.

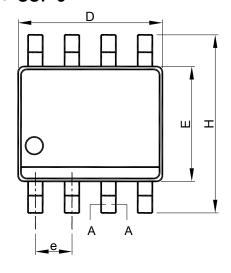

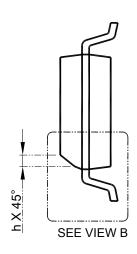

- 4. Logically the large current on the converter should flow at the same direction.
- In order to prevent the effect from noise, the IC's GND pin should be placed close to the ground of
- the input bypass capacitor.
- The FB pin should be connected to the feedback resistors directly and the route should be away from the noise sources.

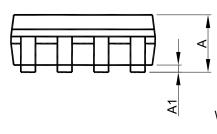

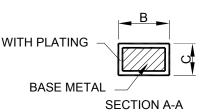

# ■ PHYSICAL DIMENSIONS
